

# Enhanced Performance Delay and Liveness Monitoring in Segment Routing Networks

*draft-gandhi-spring-sr-enhanced-plm-03*

*Rakesh Gandhi - Cisco Systems ([rgandhi@cisco.com](mailto:rgandhi@cisco.com)) - Presenter*

*Clarence Filsfils - Cisco Systems ([cfilsfil@cisco.com](mailto:cfilsfil@cisco.com))*

*Navin Vaghamshi - Reliance ([Navin.Vaghamshi@ril.com](mailto:Navin.Vaghamshi@ril.com))*

*Moses Nagarajah - Telstra ([Moses.Nagarajah@team.telstra.com](mailto:Moses.Nagarajah@team.telstra.com))*

*Richard Foote - Nokia ([footer.foote@nokia.com](mailto:footer.foote@nokia.com))*

# Agenda

- Requirements and Scope
- Summary
- Next Steps

# Requirements and Scope

## Requirements:

- Performance Delay Monitoring & Liveness Monitoring in SR networks
  - ✓ End-to-end P2P/P2MP SR paths
  - ✓ Applicable to SR-MPLS/SRv6 data planes
- Running single protocol in SR networks
  - ✓ Simplify implementations and reduce development cost
  - ✓ Simplify deployment and reduce operational complexity
- No reflector dependency
  - ✓ Stateless on reflector (e.g. reflector unaware of the monitoring protocol)
    - ✓ State is in the probe message - spirit of SR
  - ✓ Higher scale and faster detection interval

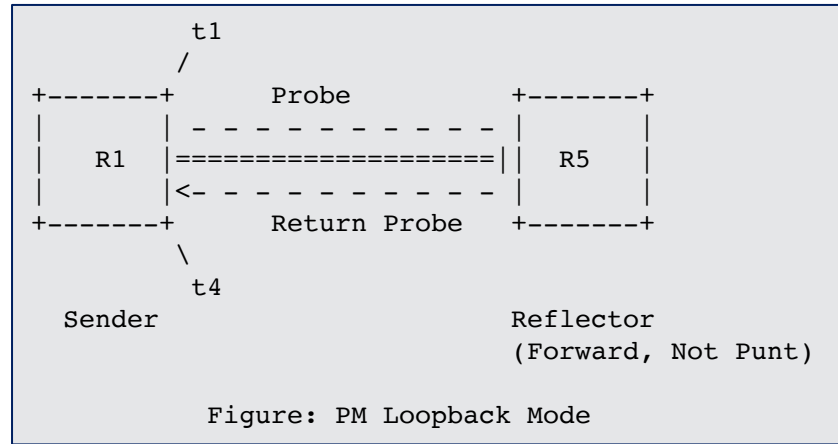

## Scope:

- RFC 5357 (TWAMP Light) compatible probe message
- RFC 8762 (Simple TWAMP (STAMP)) compatible probe message

# History of the Draft

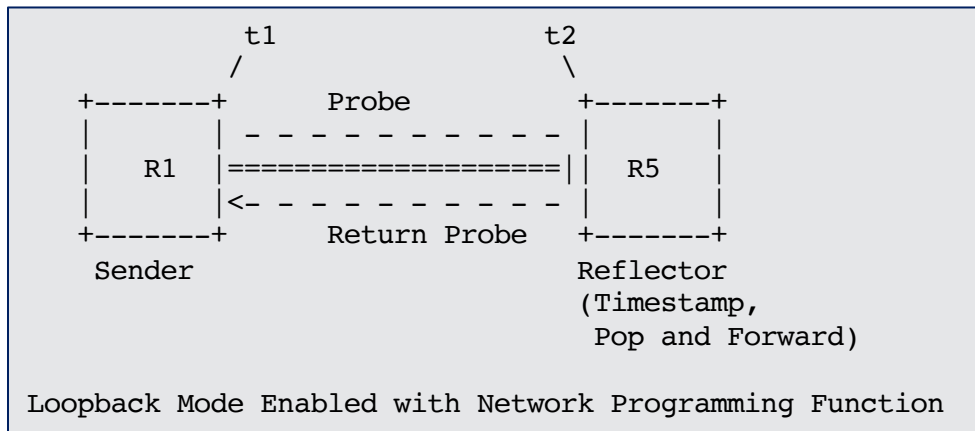

- March 2020
  - Draft was published
- April 2020
  - Presented version 00 in IETF 107 Virtual MPLS WG Meeting
- July 2020
  - Presented version 02 in IETF 108 Online SPRING WG meeting
- September 2020
  - Presented version 02 in MPLS WG Interim meeting

# PM Probes in Loopback Mode for SR Policy

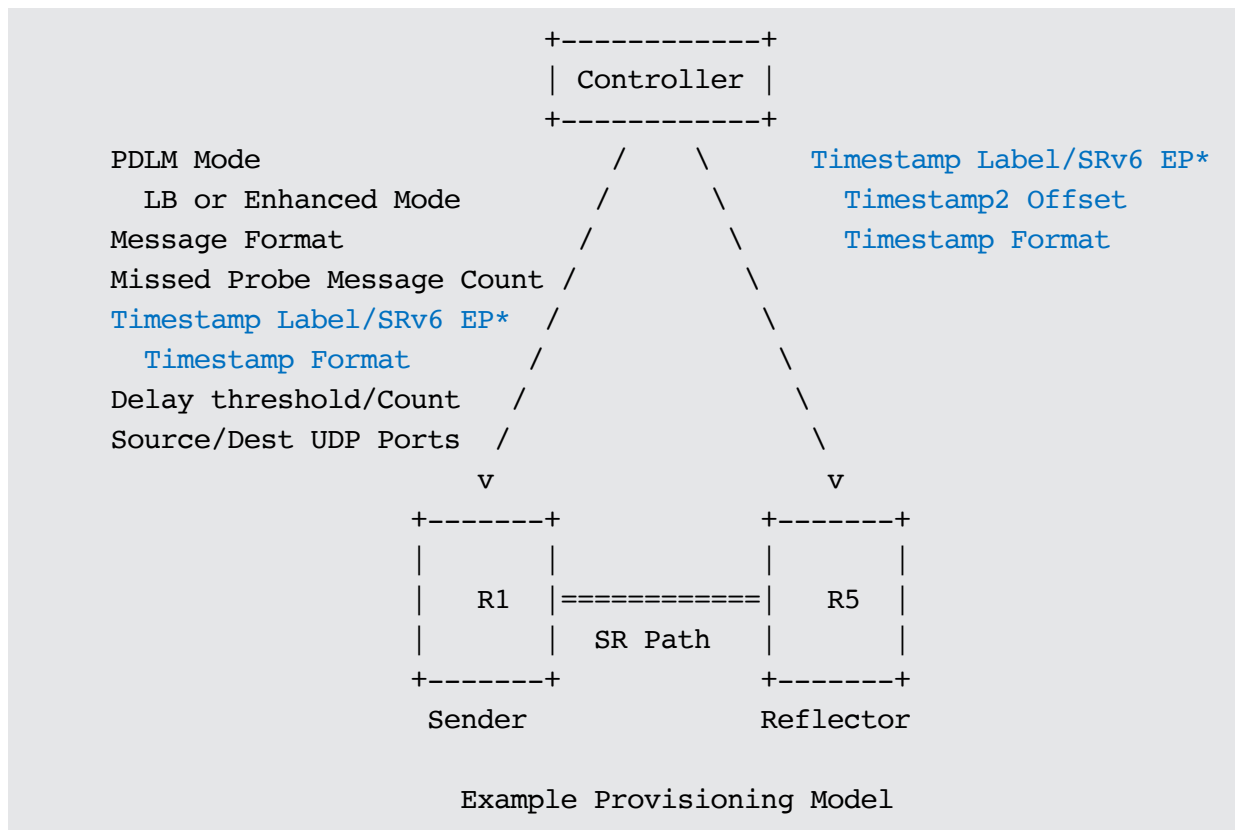

- Using PM delay measurement probe messages in Loopback Mode
- Probe messages are sent using Segment List(s) of the SR Policy Candidate Path(s)
- Probe messages are not punted on the reflector node out of fast-path in forwarding
- Reflector is agnostic to the monitoring protocol
- Round-trip delay =  $(t4 - t1)$

# Loopback Mode Enabled with Network Programming Function

- PM probes sent in loopback mode enabled with network programming function
  - The network programming function optimizes the "operations of punt and inject the probe packet" on the reflector node
  - As probe packets are forwarded in fast-path, higher scale with faster interval is possible resulting in faster failure detection
- Reflector node adds the receive timestamp at a specific location in the payload of the received probe message in fast-path
  - Only adds the receive timestamp if the source address or destination address in the probe message matches the local node address
  - Ensure loopback probe packets return from the intended reflector node
- One-way delay =  $(t2 - t1)$

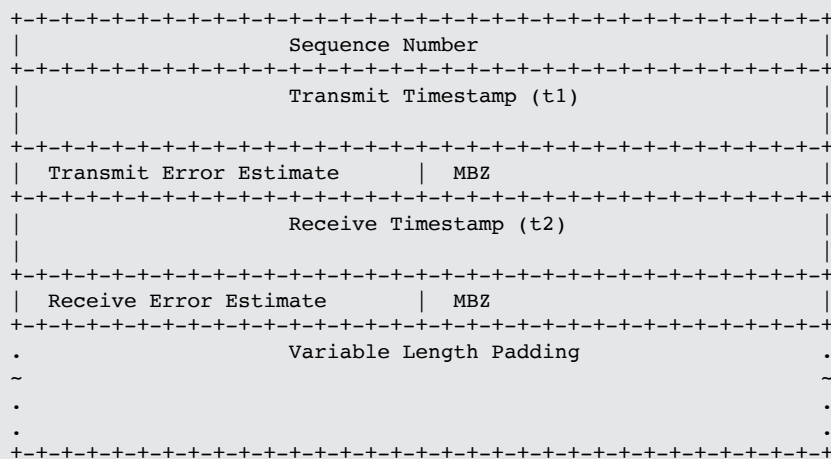

# Example Provisioning Model

\* Provisioned,  
Flooded/Signaled  
or IANA Allocated

# Probe Message Formats

- Leverage existing TWAMP implementations and deployments using compatible probe message format
- Sender adds Transmit Timestamp ( $t_1$ )
- Reflector adds Receive Timestamp ( $t_2$ ) at offset-byte location in payload
  - offset-byte 16 from the start of the payload, or
  - locally provisioned location (consistently in the network)

# TWAMP Compatible Probe Message Format

## STAMP Compatible Probe Message Format

# SR-MPLS with Timestamp Label

```
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
+-+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
|          Label(1)          | TC | S |          TTL          |
+-+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
.
.
.
+-+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
|          Label(n)          | TC | S |          TTL          |
+-+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
|          Extension Label (15)          | TC | S |          TTL          |
+-+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
|          Timestamp Label (TBA1)          | TC | S |          TTL          |
+-+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
| IP Header                  |
. Source IP Address = Reflector IPv4 or IPv6 Address
. Destination IP Address = Sender IPv4 or IPv6 Address
.
+-----+
| UDP Header                  |
. Source Port = As chosen by Sender
. Destination Port = As chosen by Sender
.
+-----+
| Payload                     |
.
+-----+
```

Example Probe Message with Timestamp Label for SR-MPLS

- Timestamp label (TBA1) is defined for Timestamp, Pop and Forward function
- Reverse Path can be IP or SR-MPLS
- Source and Destination Addresses are swapped that represent the Reverse direction path

# SRv6 with Timestamp Endpoint Function

```
+-----+
| IP Header                                     |
. Source IP Address = Sender IPv6 Address      .
. Destination IP Address = Destination IPv6 Address .
.                                             .
+-----+
| SRH as specified in RFC 8754                |
. <Segment List>                             .
. End.TSF (TBA2) with Reflector SID          .
.                                             .
+-----+
| IP Header                                     |
. Source IP Address = Reflector IPv6 Address .
. Destination IP Address = Sender IPv6 Address .
.                                             .
+-----+
| UDP Header                                   |
. Source Port = As chosen by Sender           .
. Destination Port = As chosen by Sender      .
.                                             .
+-----+
| Payload                                     |
.                                             .
+-----+
```

Example Probe Message with Timestamp Endpoint Function for SRv6

- Timestamp Endpoint Function End.TSF (TBA2) is defined for Timestamp and Forward and is carried with the Reflector node SID
- Reverse path can be IP
  - Reflector node removes SRH
- Reverse path can be SR
  - Reverse direction SR path Segment-list carried in SRH
  - Reflector node does not remove the SRH
- Source and Destination Addresses are swapped that represent the Reverse direction path in the inner IPv6 header

# ECMP Support for SR Paths

- SR Paths can have ECMPs between the ingress and transit nodes, between transit nodes and between transit and egress nodes.
- PM probe messages can take advantage of the hashing function in forwarding plane to explore ECMP paths.
- Existing forwarding mechanisms are applicable to PM probe messages. Examples are:
  - For IPv4 when return path is also SR-MPLS
    - Sweeping destination address in IPv4 header (e.g. 127/8)
  - For IPv6
    - Sweeping flow label in IPv6 header

# Notifications

- Delay metrics are notified as an example, when consecutive M number of probe messages have delay values exceed the configured thresholds
- Liveness failure (bring-down - loss of heart beats) is notified when consecutive N number of return probe messages are not received at the sender node
- Liveness success (bring-up - success of heart beats) initially is notified as soon as one or more return probe messages are received at the sender node

# Next Steps

- Welcome your comments and suggestions
- Requesting SPRING WG adoption

# Thank you

# Backup

# Loopback Mode with Timestamp and Forward for SR-MPLS Policy

# Thank you
